
$\qquad$

$\qquad$
$\qquad$

## Answer

- $\mathrm{K}=\left[\mathrm{SO}_{3}\right]^{2}$
- $\left[\mathrm{SO}_{2}\right]^{2}\left[\mathrm{O}_{2}\right]$
- $4.34=\left[\mathrm{SO}_{3}\right]^{2}$
$\qquad$
$\qquad$
$\qquad$
$-\quad[.28]^{2}[.43]$
$\circ\left[\mathrm{SO}_{3}\right]=.38 \mathrm{M}$

## Reaction Quotient, Q

- The reaction quotient, Q, gives us a value of current concentrations of all chemicals before they complete reacting towards equilibrium.
- It is calculated the same way as $K$ except you use current concentrations.
- Comparing the Q value to the K value allows you to determine which way the reaction will shift.

## $K$ and $Q$ values

and Q are calculated by products over eactants.
Larger values mean higher products, smaller $\qquad$ mean higher reactants.
o If $\mathbf{K}$ is larger than $\mathbf{Q}$, it means that $Q$ has a $\qquad$
higher concentration of reactants so the reaction will shift to the right.
If $\mathbf{K}$ is smaller than $\mathbf{Q}$, it means that $Q$ has a higher concentration of products so the reaction will shift to the left.
$\bigcirc$ If $\mathbf{K}$ equals $\mathbf{Q}$ you are at equilibrium, no shift

## Easy way to remember

- Greater than, less than signs are an arrow!!!
- Put K first, then Q and determine which is larger.
- $K>Q$, shift right
$\circ K<Q$, shift left
$\circ K=Q$, No shift

|  | Q problem |  |  |
| :---: | :---: | :---: | :---: |
|  | o The K is . 060 for the reaction:$\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightleftharpoons 2 \mathrm{NH}_{3}$Calculate Q and determine which way the reaction will shift |  |  |
|  | [ $\mathrm{N}_{2}$ ] (M) | [ $\mathrm{H}_{2}$ ] (M) | $\left[\mathrm{NH}_{3}\right](\mathrm{M})$ |
| Case 1 | $1.0 \times 10^{-5}$ | $2.0 \times 10^{-3}$ | $1.0 \times 10^{-3}$ |
| Case 2 | $1.5 \times 10^{-5}$ | $3.54 \times 10^{-1}$ | $2.0 \times 10^{-4}$ |
| Case 3 | 5.0 | $1.0 \times 10^{-2}$ | $1.0 \times 10^{-4}$ |

$\qquad$
$\qquad$

- $\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightleftharpoons 2 \mathrm{NH}_{3}$ $\qquad$
ander $\left[\mathrm{N}_{2}\right](\mathrm{M}) \quad\left[\mathrm{H}_{2}\right](\mathrm{M}) \quad\left[\mathrm{NH}_{3}\right](\mathrm{M})$ $.0 \times 10^{-5} \quad 2.0 \times 10^{-3}$ $1.0 \times 10^{-3}$

## Solution equilibrium

- For Example:
- Lead (II) Bromide
$-\mathrm{PbBr}_{2(\mathrm{~s})} \rightleftharpoons \mathrm{Pb}^{2+}{ }_{(\mathrm{aq})}+2 \mathrm{Br}_{(\mathrm{aq})}$
- What would the equilibrium expression look like?
- $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{Br}^{-}\right]^{2}$
- Equilibrium constants for dissociations are called solubility products, and are denoted by $\mathbf{K}_{\mathbf{s p}}$.

Cont.
The $\mathrm{K}_{\text {sp }}$ value for $\mathrm{PbBr}_{2}$ is $5.0 \times 10^{-6}$.
$\mathrm{PbBr}_{\text {(s) }} \rightleftharpoons \mathrm{Pb}^{2+}{ }_{(\mathrm{aq})}+2 \mathrm{Br}_{(\mathrm{aq})}^{-}$
Say the maximum moles of $\mathrm{PbBr}_{2}$ that can dissolve is $\times$ moles per 1 L .

- Using the balanced equation, I will have $x$ mole/L of $\mathrm{Pb}^{2+}$ and $2 x$ mole/L of $\mathrm{Br}^{-}$
- So
$5.0 \times 10^{-6}=x(2 x)^{2}$
$5.0 \times 10^{-6}=4 x^{3}$
$\circ \mathrm{x}=.011 \mathrm{M}$ This is the solubility, or maximum amount of solute, $\mathrm{PbBr}_{2}$, that will dissolve.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\circ\left[\mathrm{Pb}^{2+}\right]=.011 \mathrm{M} \quad 2 \mathrm{x}=[\mathrm{Br}]=.022 \mathrm{M}$

## This means

- A solution of $\mathrm{PbBr}_{2}$ would be saturated
$\qquad$ with $\left[\mathrm{PbBr}_{2}\right]=.011 \mathrm{M}$
- After I reach that level, no more will $\qquad$ dissolve.
- This is a very low concentration, so we $\qquad$ say the is compound is insoluble.
- In the solution, the ion concentrations would be
$-\left[\mathrm{Pb}^{2+}\right]=.011 \mathrm{M}$
$\circ\left[\mathrm{Br}^{-}\right]=.022 \mathrm{M}$

## Problems

- Calculate the solubility and saturation $\qquad$ concentrations of ions in aluminum hydroxide $\mathrm{K}_{\mathrm{sp}}=5.0 \times 10^{-33}$, and Barium $\qquad$ sulfate $\mathrm{K}_{\mathrm{sp}}=1.4 \times 10^{-14}$

Answer
$-\mathrm{Al}(\mathrm{OH})_{3} \rightleftharpoons \mathrm{Al}^{3+}{ }_{(\mathrm{aq})}+3 \mathrm{OH}^{-}{ }_{(\mathrm{aq})}$

- $\mathrm{K}_{\text {sp }}=\left[\mathrm{Al}^{3+}\right]\left[\mathrm{OH}^{-}\right]^{3}$
- $5.0 \times 10^{-33}=x(3 x)^{3}$
- $x=3.7 \times 10^{-9} \mathrm{M}$ (solubility)
$\qquad$
$\qquad$
$\qquad$
- $\left[\mathrm{Al}^{3+}\right]=3.7 \times 10^{-9} \mathrm{M}$
- $3 x=\left[\mathrm{OH}^{-}\right]=1.1 \times 10^{-8} \mathrm{M}$

Answer
$-\mathrm{BaSO}_{4} \rightleftharpoons \mathrm{Ba}^{2+}{ }_{(\mathrm{aq})}+\mathrm{SO}_{4}{ }^{2-}{ }_{(\mathrm{aq})}$

- $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$
- $1.4 \times 10^{-14}=x(x)$
- $x=1.2 \times 10^{-7} \mathrm{M}$ (solubility)
$-\left[\mathrm{Ba}^{2+}\right]=1.2 \times 10^{-7} \mathrm{M}$ $\qquad$
$\circ\left[\mathrm{SO}_{4}{ }^{2-}\right]=1.2 \times 10^{-7} \mathrm{M}$
